# Azure App Service

---

Azure App Service provides an integrated cloud app platform for delivering modern enterprise apps across cloud and mobile devices. Azure App Service is an integrated offering that delivers features and capabilities from a number of existing Azure services – Websites, Mobile Services, API Mgmt. and BizTalk Services

# App Service Family

# App Service

- Service for hosting web applications, REST APIs, and mobile backends can be developed in many of the following languages:

.NET

Java

Ruby

Node.JS

PHP

Python

- Applications can execute and scale in a fully managed, sandbox environment

# Key features of App Service Web Apps

- Multiple languages and frameworks:
  - First-class support for Microsoft ASP.NET, Java, Ruby, Node.js, PHP, or Python
- DevOps optimization:
  - Continuous integration and deployment with Visual Studio Team Services, GitHub, Bitbucket, Docker Hub, or Azure Container Registry
- Global scale with high availability:
  - Scale up or out manually or automatically. Host anywhere in the Microsoft global datacenter infrastructure
- Connections to SaaS platforms and on-premises data:
  - More than 50 connectors for enterprise systems (such as SAP), SaaS services (such as Salesforce), and internet services (such as Facebook)

# Key features of App Service Web Apps (cont.)

- Security and compliance:
  - App Service is ISO, SOC, and PCI compliant
- Application templates:
  - Templates in the Azure Marketplace, such as WordPress, Joomla, and Drupal
- Visual Studio integration:
  - Streamline the work of creating, deploying, and debugging
- API and mobile features:
  - Turn-key Cross-Origin Resource Sharing (CORS) support for RESTful API scenarios, and enables authentication, offline data sync, push notifications, and more
- Serverless code:
  - Run code on-demand without having to explicitly provision or manage infrastructure

# App Service Plans

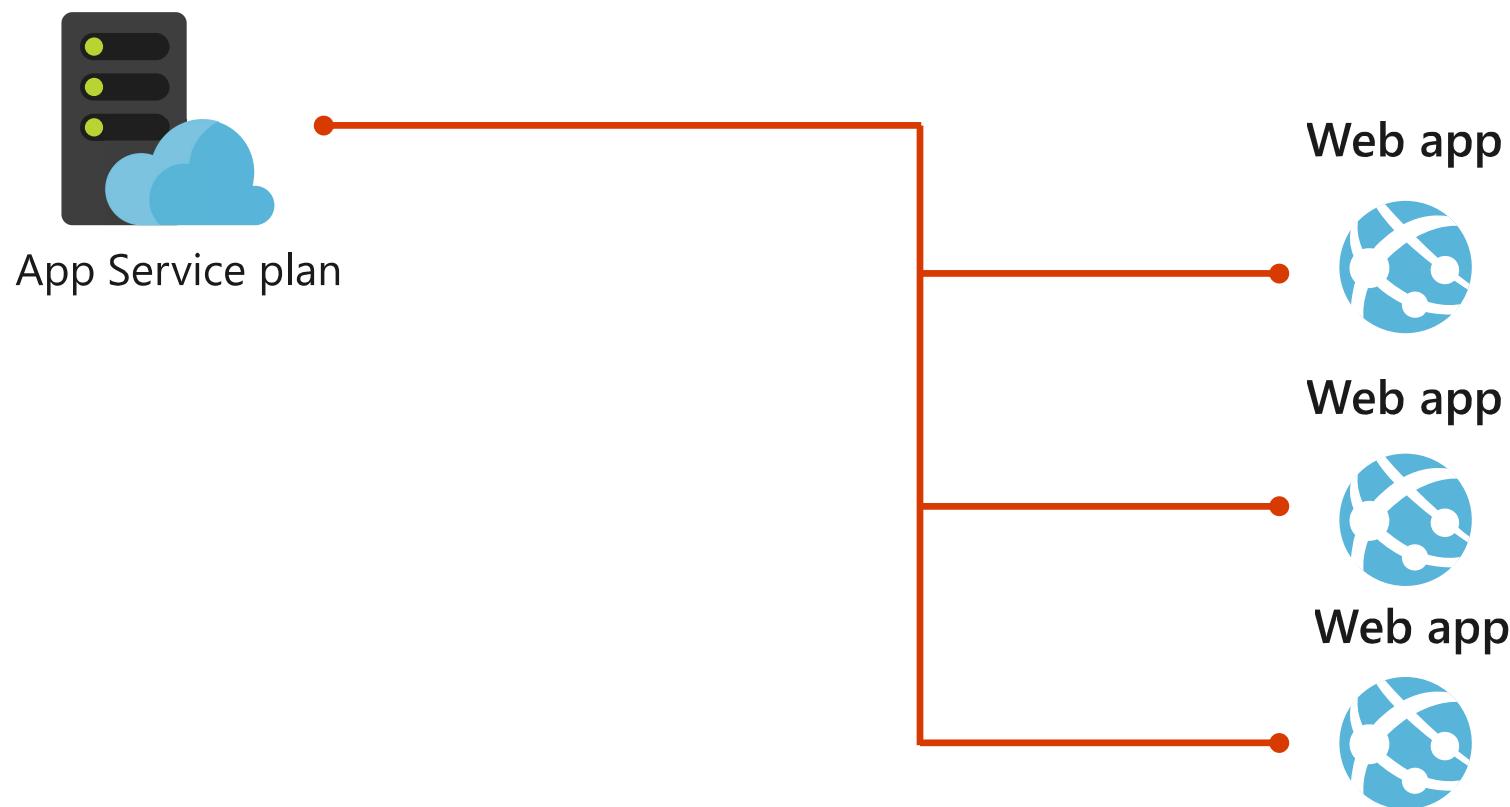

- Define a set of compute resources for a web app to run
- Determines performance, price, and features
- One or more apps can be configured to run in the same App Service plan
- App Service plans define:
  - Region where compute resources will be created
  - Number of virtual machine instances
  - Size of virtual machine instances (Small, Medium, Large)
  - Pricing tier (next slide)

# App Service Plans – Pricing Tier

	Free	Shared	Basic	Standard	Premium	Isolated
# of Apps	10	100	Unlimited	Unlimited	Unlimited	Unlimited
Disk Space	1 GB	1 GB	10 GB	50 GB	250 GB	1 TB
Maximum Instances	1	1	3	10	20	100
Autoscale	No	No	No	Yes	Yes	Yes
Staging Environments	No	No	No	5	20	100
Custom Domains	No	Yes	Yes	Yes	Yes	Yes
SLA				99.95%		

- Shared compute (Free and Shared). Run apps on the same Azure VM as other App Service apps, and the resources cannot scale out
- Dedicated compute (Basic, Standard, Premium). Run apps in the same plan in dedicated Azure VMs
- Isolated. Runs apps on dedicated Azure VMs in dedicated Azure virtual networks

# App Service Plans (continued)

# Creating an App Service

- Name must be unique
- Access using *azurewebsites.net* – can map to a custom domain
- Publish Code (Runtime Stack)
- Publish Docker Image (Image source)
- Linux or Windows
- Region closest to your users
- App Service Plan

Web App   \* Basics   Tags   Review and create

**Project Details**

1 GB memory Change size

The screenshot shows the 'Create a Web App' wizard in the Azure portal. It's on the 'Basics' tab. The 'Project Details' section shows a 'Subscription' dropdown set to 'Concierge Subscription' and a 'Resource Group' dropdown set to 'Learn-11111111-2222-3333-4444-555555555555'. The 'Instance Details' section includes fields for 'Name' (set to 'your-app-name'), 'Publish' (set to 'Code'), 'Runtime stack' (set to '.NET Core 2.2'), 'Operating System' (set to 'Windows'), and 'Region' (set to 'Central US'). The 'App Service Plan' section shows a 'Linux Plan' dropdown set to '(New) ASP-Learn-11111111-2222-3333-4444' and a 'Sku and size' dropdown set to 'Free F1' with '1 GB memory' selected.

**Demo & Lab:  
Create & Deploy First  
Web App**

# App Service settings

- Overrides settings in Web.config or appsettings.json
- Hidden by default in Azure portal
- You can configure:

Application  
settings

Connection  
strings

Default  
documents

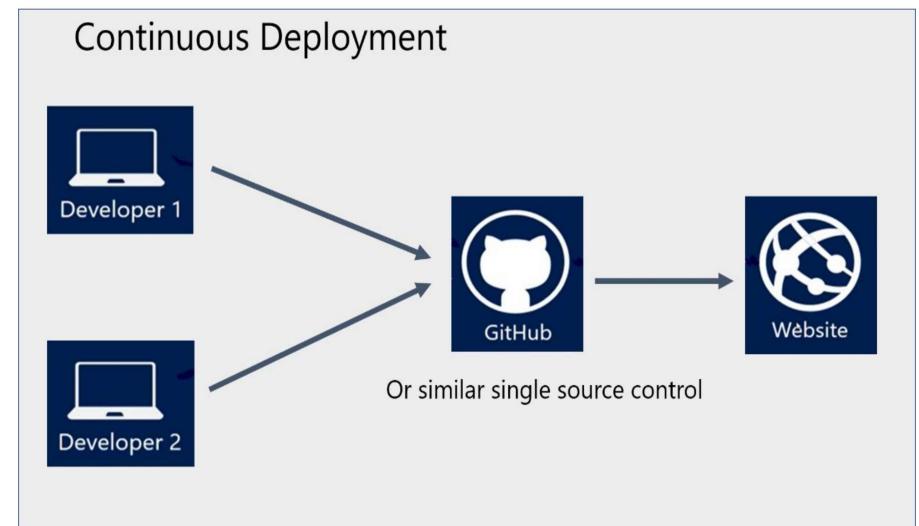

Path mappings

Language  
stack (app  
runtime)

Custom  
containers

# Continuous Deployment

- Work in a single source control
- Whenever code updates are pushed to the source control, then the website or web app will automatically pick up the updates
- A continuous deployment workflow publishes the most recent updates from a project
- Use the portal for continuous deployments from GitHub, Bitbucket, or Visual Studio Team Services

# Azure App Service Staging Environment

# Publishing from Source Control

## Supported Options

Azure Repos

GitHub

Bitbucket

Local Git

OneDrive

Dropbox

External

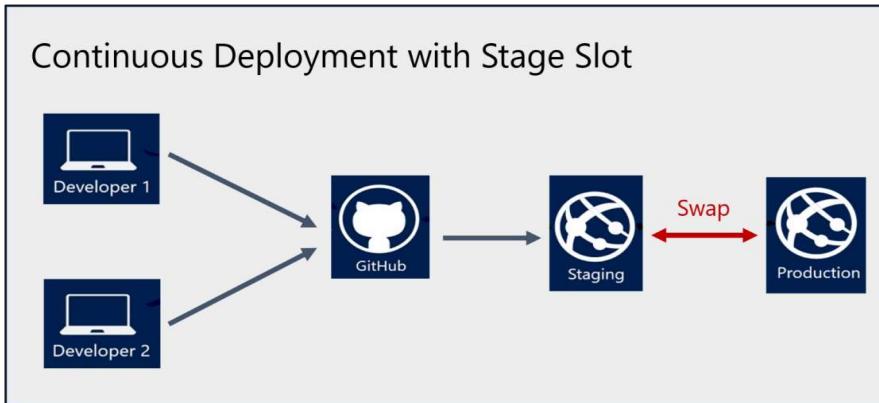

FTP

# Azure App Service Staging Environment

- When you have a successful or business-critical web app, you need to update it to respond to business changes, user demands, or security issues. But you can't allow service interruptions.
- Suppose you work for a company that runs a popular social media web platform. The user interface for this platform is set up as an ASP.NET Core MVC web app that's hosted in Azure App Service. You regularly update the app's source code and roll out the updates to production. These updates occasionally cause problems when testers fail to catch bugs.
- You want a way to deploy a new version of the app without downtime or a service interruption. You also want to be able to rapidly roll back a new deployment to the previous version if it causes problems.

# Deployment Slots

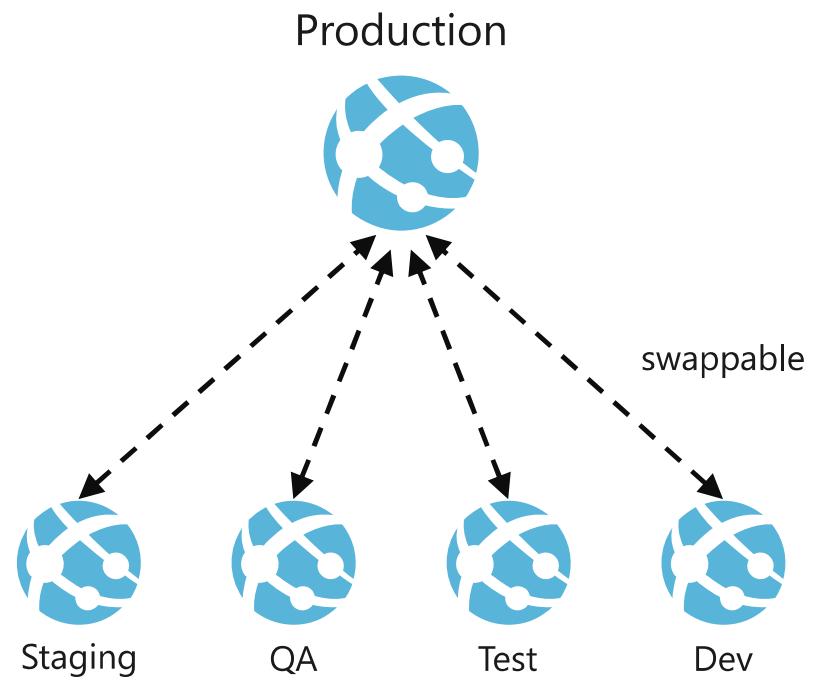

Service Plan	Slots
Free, Shared, Basic	0
Standard	Up to 5
Premium	Up to 20
Isolated	Up to 20

- Deploy to a different deployment slots (depends on service plan)
- Validate changes before sending to production
- Deployment slots are live apps with their own hostnames
- Avoids a cold start – eliminates downtime
- Fallback to a last known good site
- Auto Swap when pre-swap validation is not needed

# Deployment Slots

- Live apps with their own:
  - Host names
  - Content
  - Configuration
- Can be swapped between each other. For example:
  - Staging      ↔      Production
  - Production    ↔      Staging
  - Dev            ↔      Test
  - Test            ↔      QA
  - QA            ↔      Staging

# Deployment Slots - Example

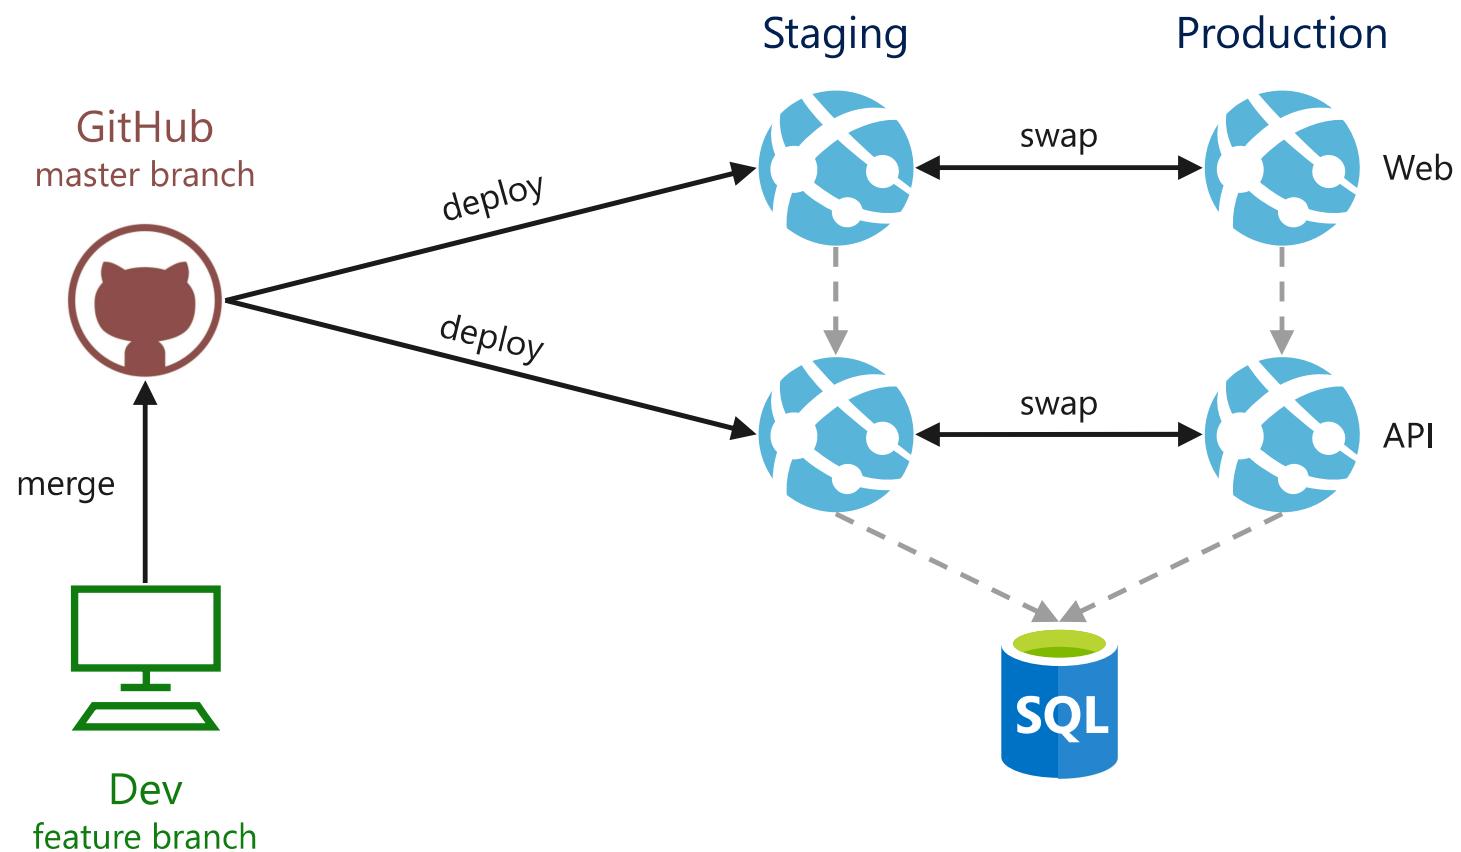

- **Production Web App URL**

contoso.azurewebsites.net

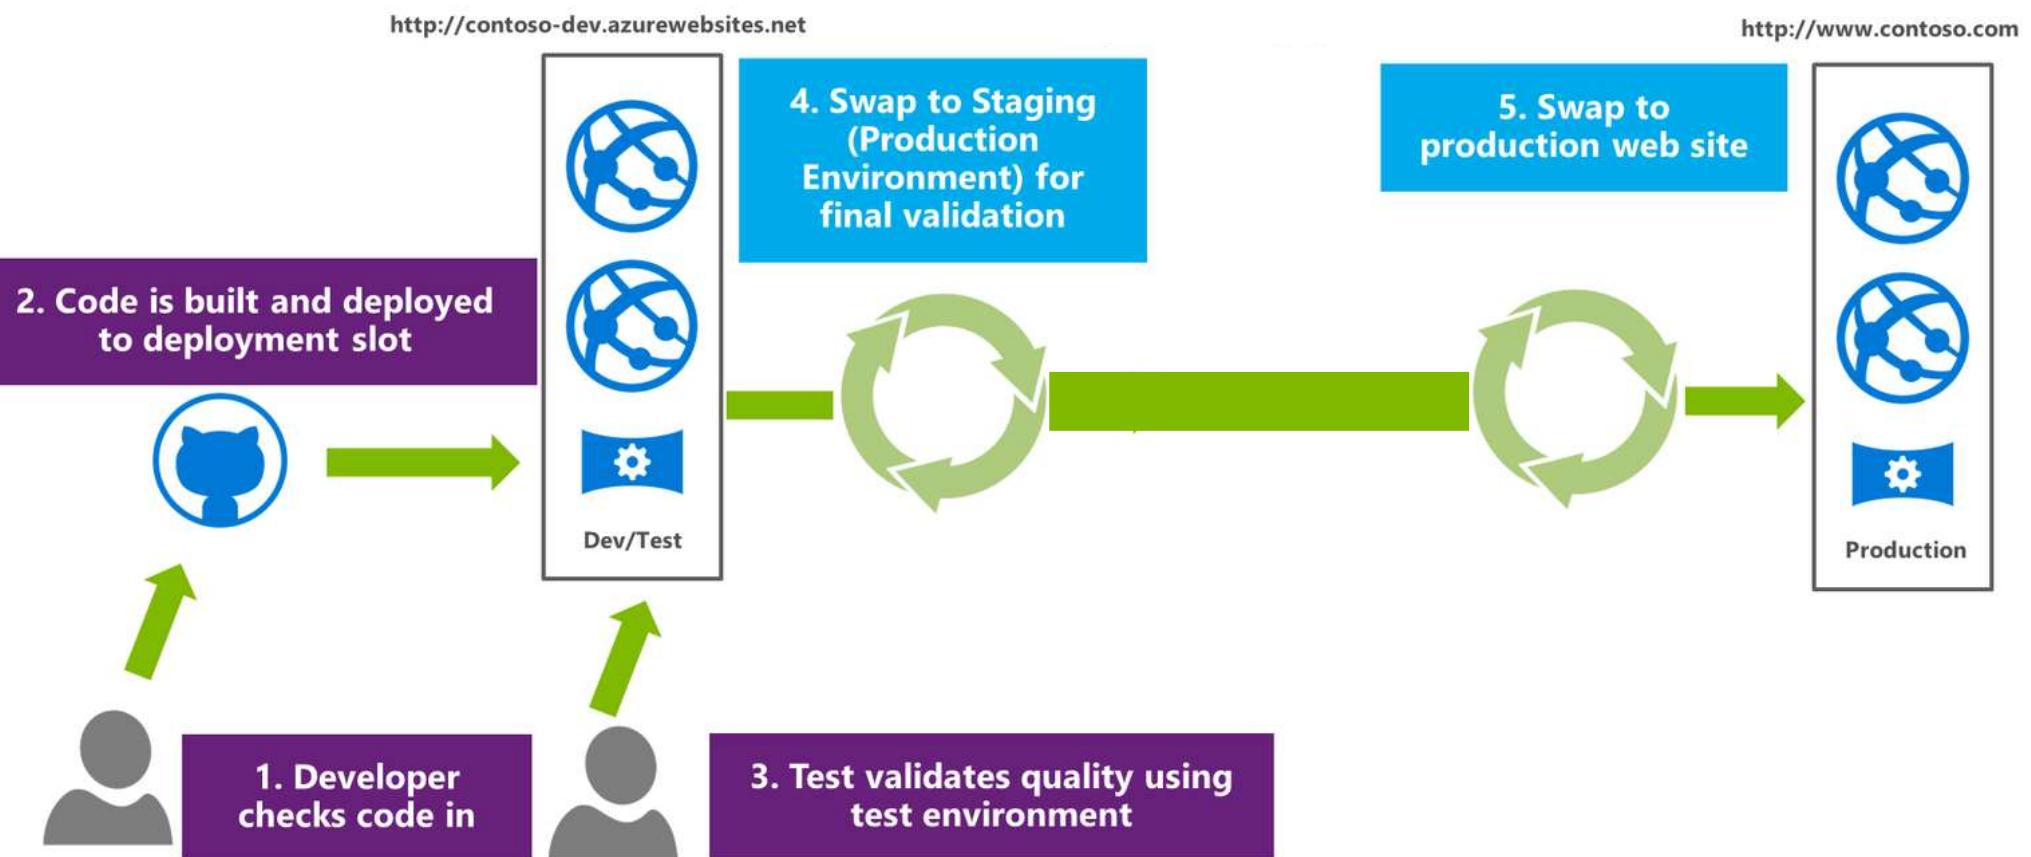

- **Deployment Slot Web App URL**

contoso-dev.azurewebsites.net

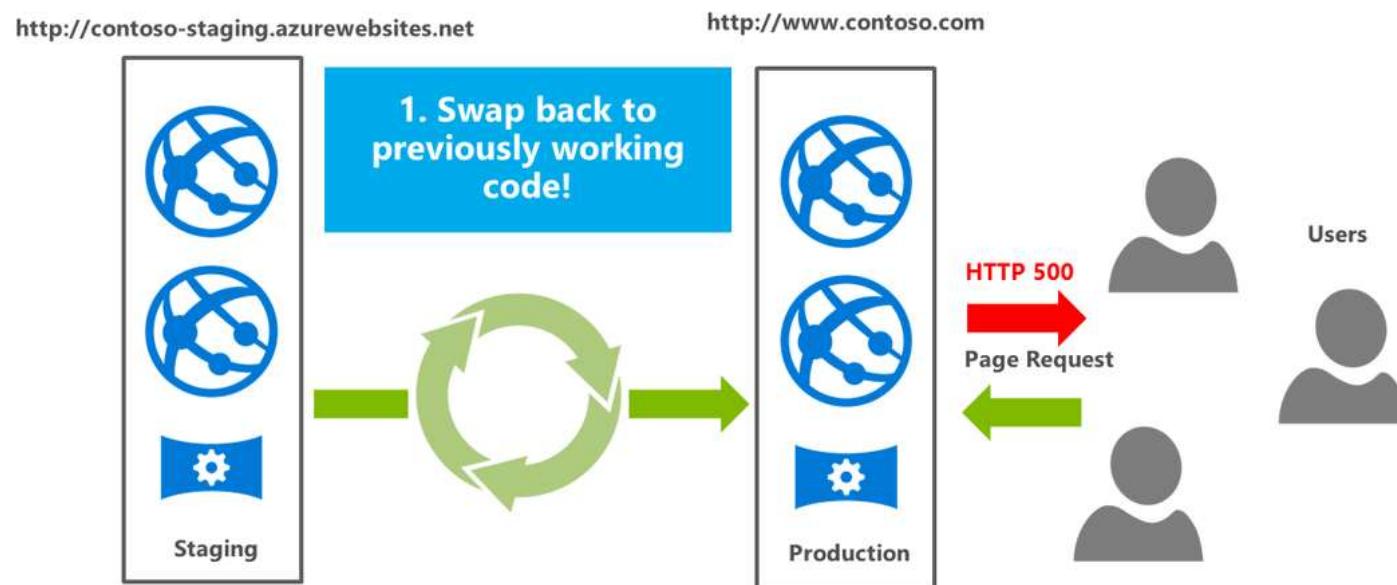

# Modern deployment workflow

# Staged Publishing

# Rollback (Oops)

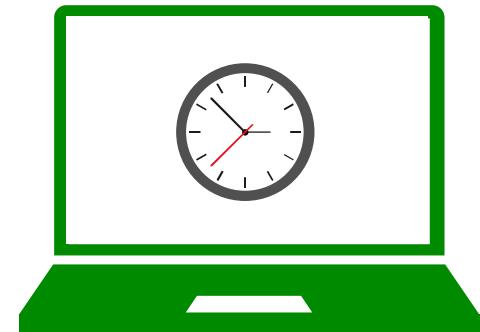

# Creating Deployment Slots

- A new slot can be empty or cloned
- When you clone, pay attention to the settings
  - Slot-specific app settings and connection strings
  - Continuous deployment settings
  - App Service authentication settings
- Not all settings are sticky (endpoints, custom domain names, SSL certificates, scaling)
- Review and edit your settings before swapping

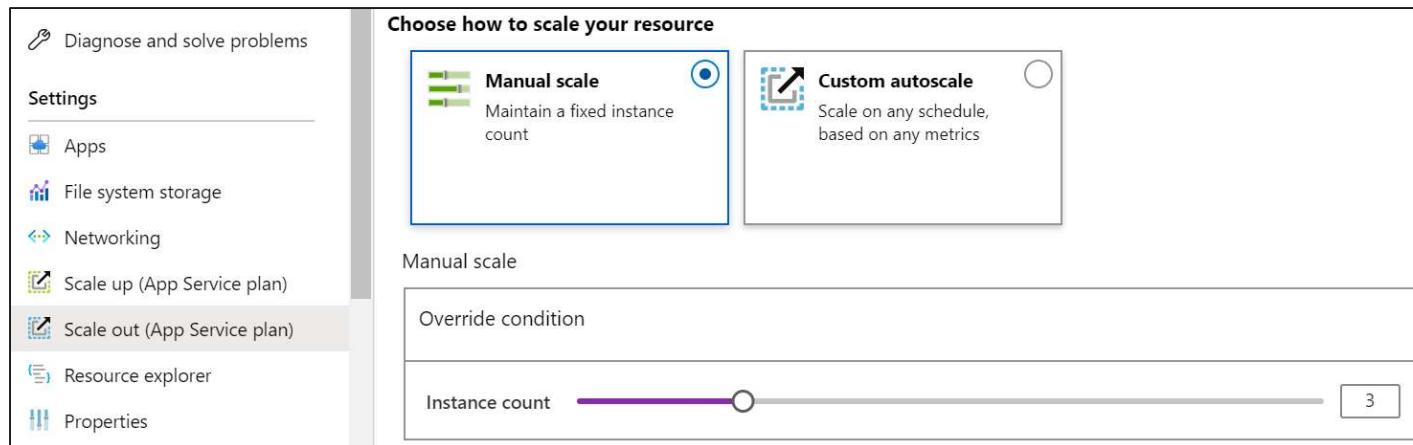

**Lab:**  
**Configure**  
**Deployment Slots**

# Scaling App Service apps

# App Service Plan Scaling

- Scale up (change the App Service plan)
  - More hardware (CPU, memory, disk)
  - More features (dedicated virtual machines, staging slots, autoscaling)
- Scale out (increase the number of VM instances)
  - Manual (fixed number of instances)
  - Autoscale (based on predefined rules and schedules)

# Autoscale

- A primary advantage of the cloud is elastic scaling (the ability to use as much capacity as you need):
  - Scaling out as load increases
  - Scaling in when the extra capacity is not needed
- Many Microsoft Azure services provide the capability to scale both manually and automatically
- Autoscale refers to the capability of many of these services to monitor the application instances and automatically scale appropriately to handle the current usage of the application:
  - Using autoscale, your cloud service can scale out and in to exactly match the amount of instances needed for your specific computing pattern

# Scaling Up vs. Scaling Out

## Scale Up

### Vary the size

- 1 Core w/ 1.75 GB RAM
- 2 Cores w/ 3.5 GB RAM
- 4 Cores w/ 7 GB RAM

## Vertical Scaling

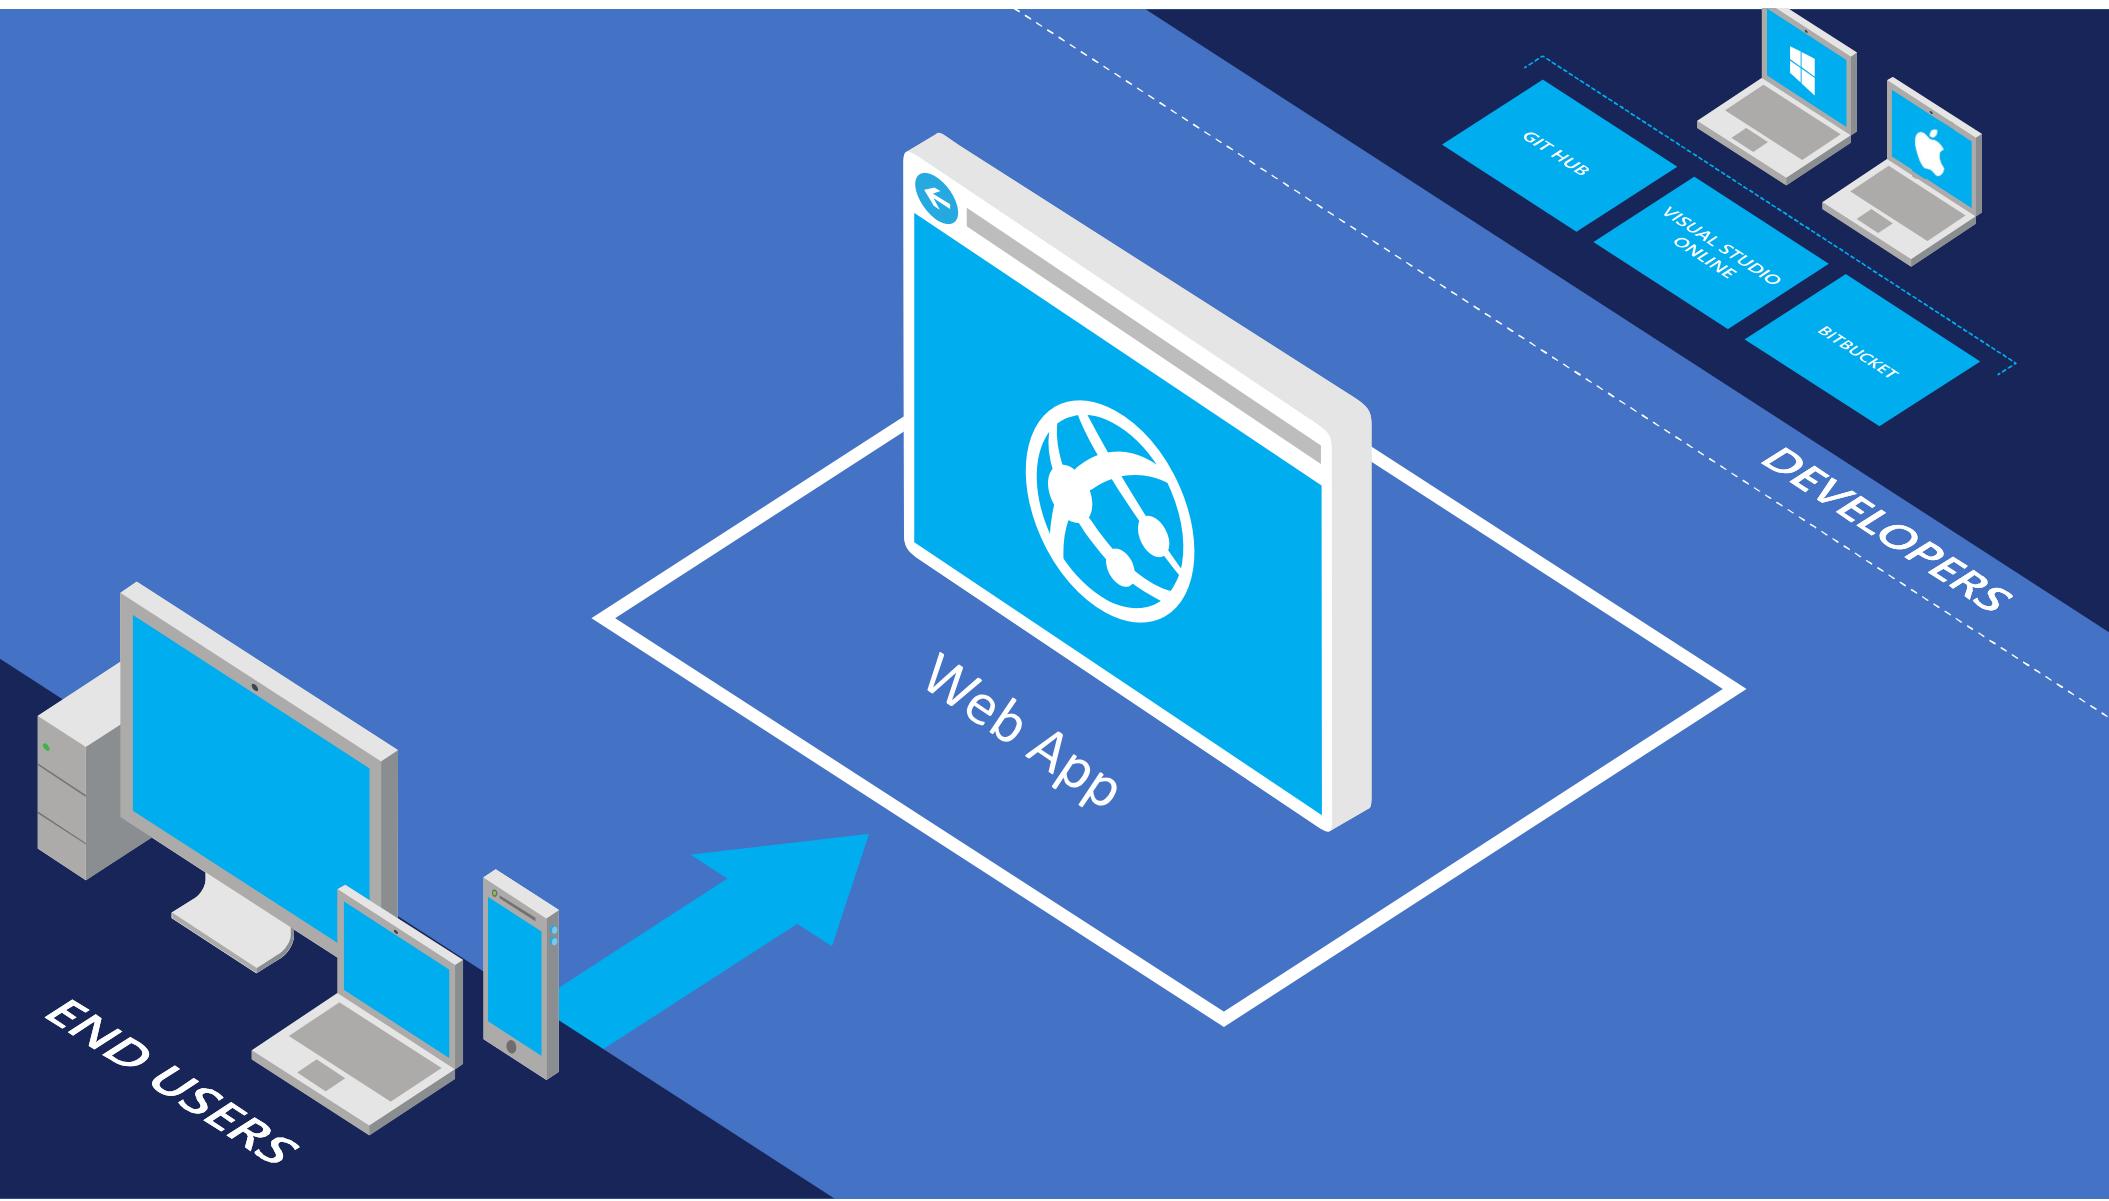

## Scale Out

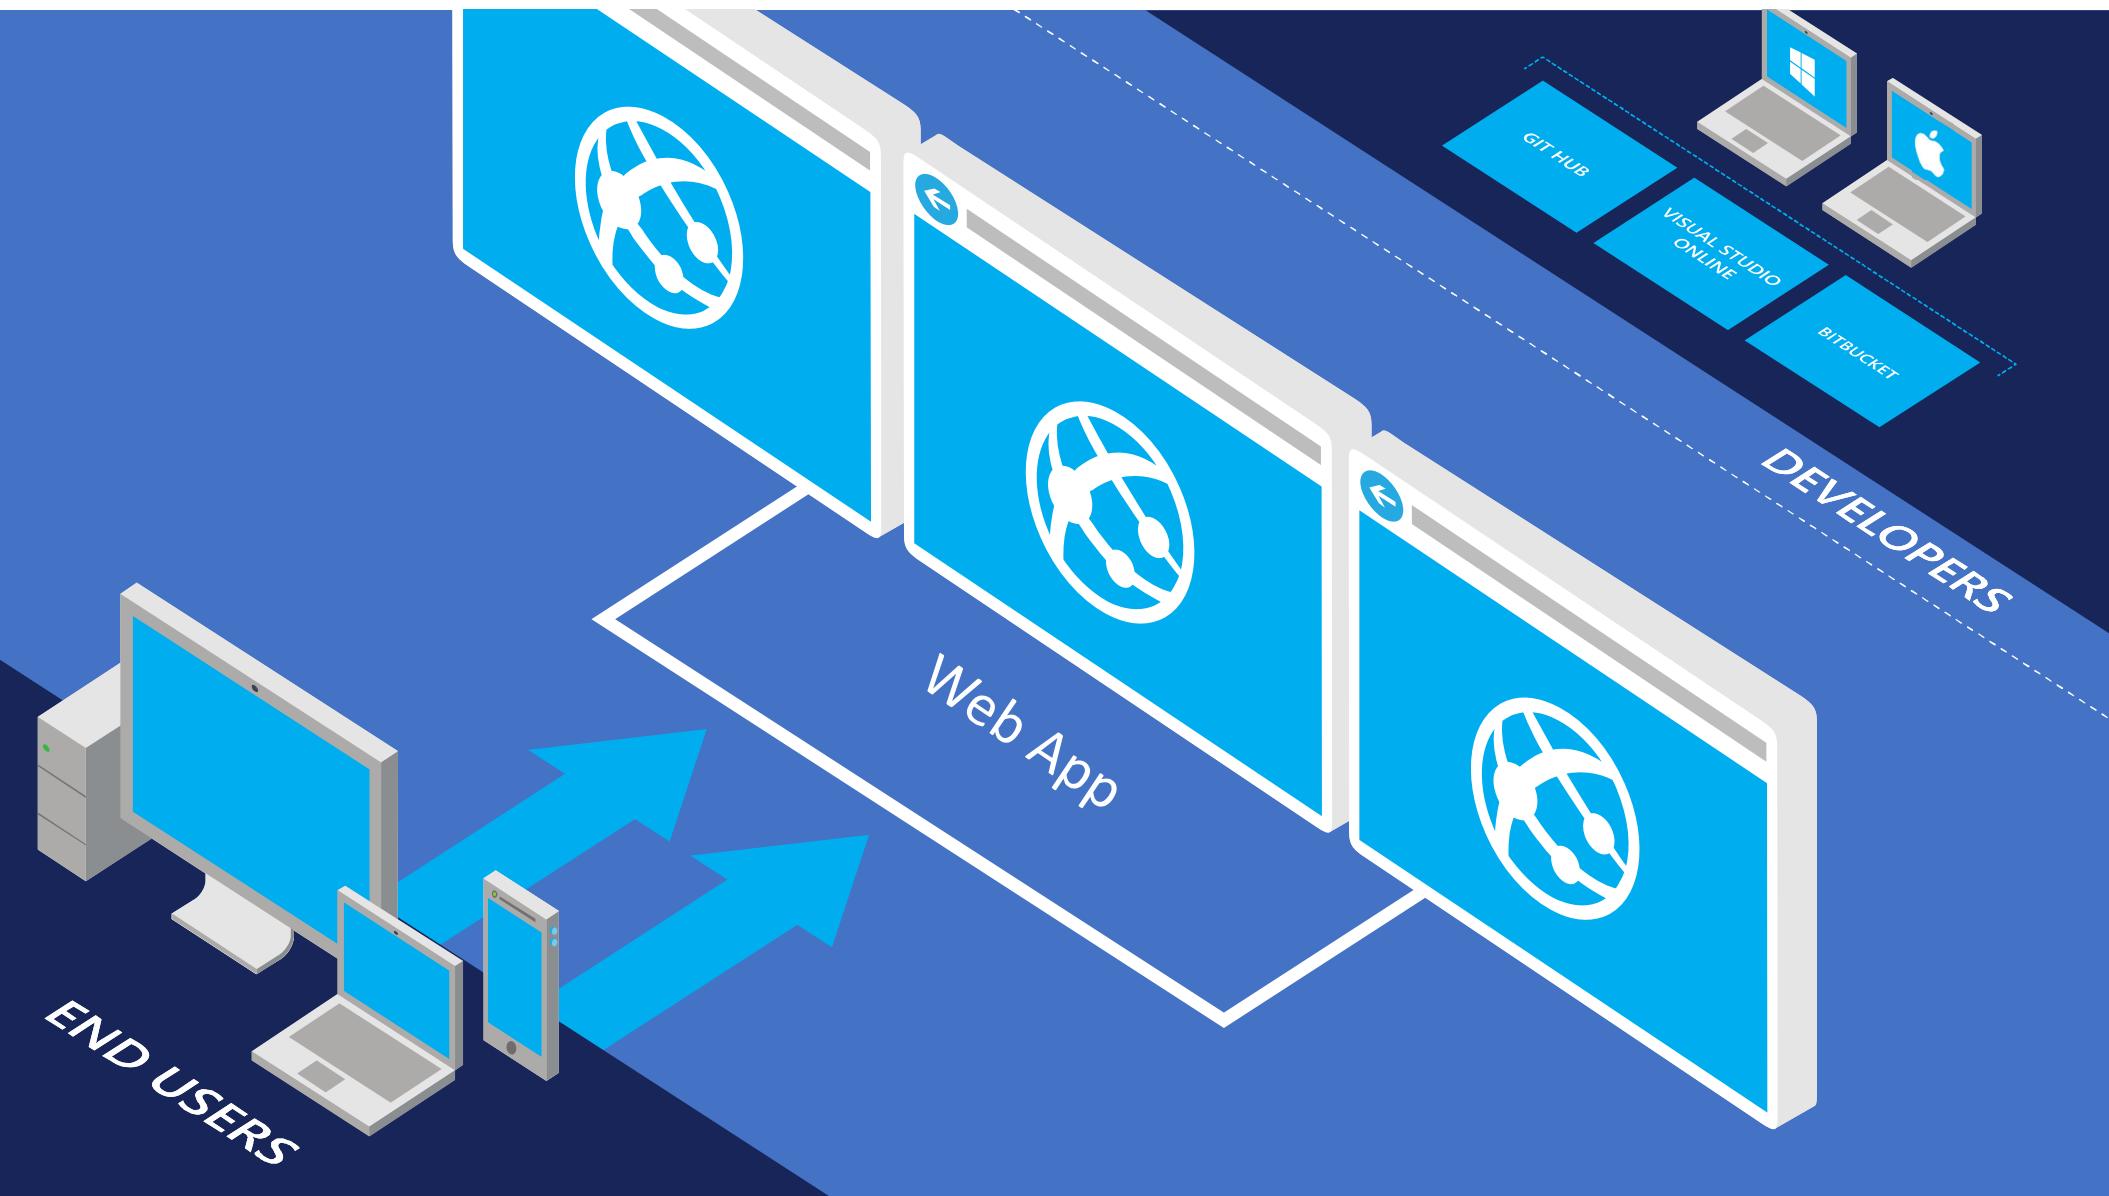

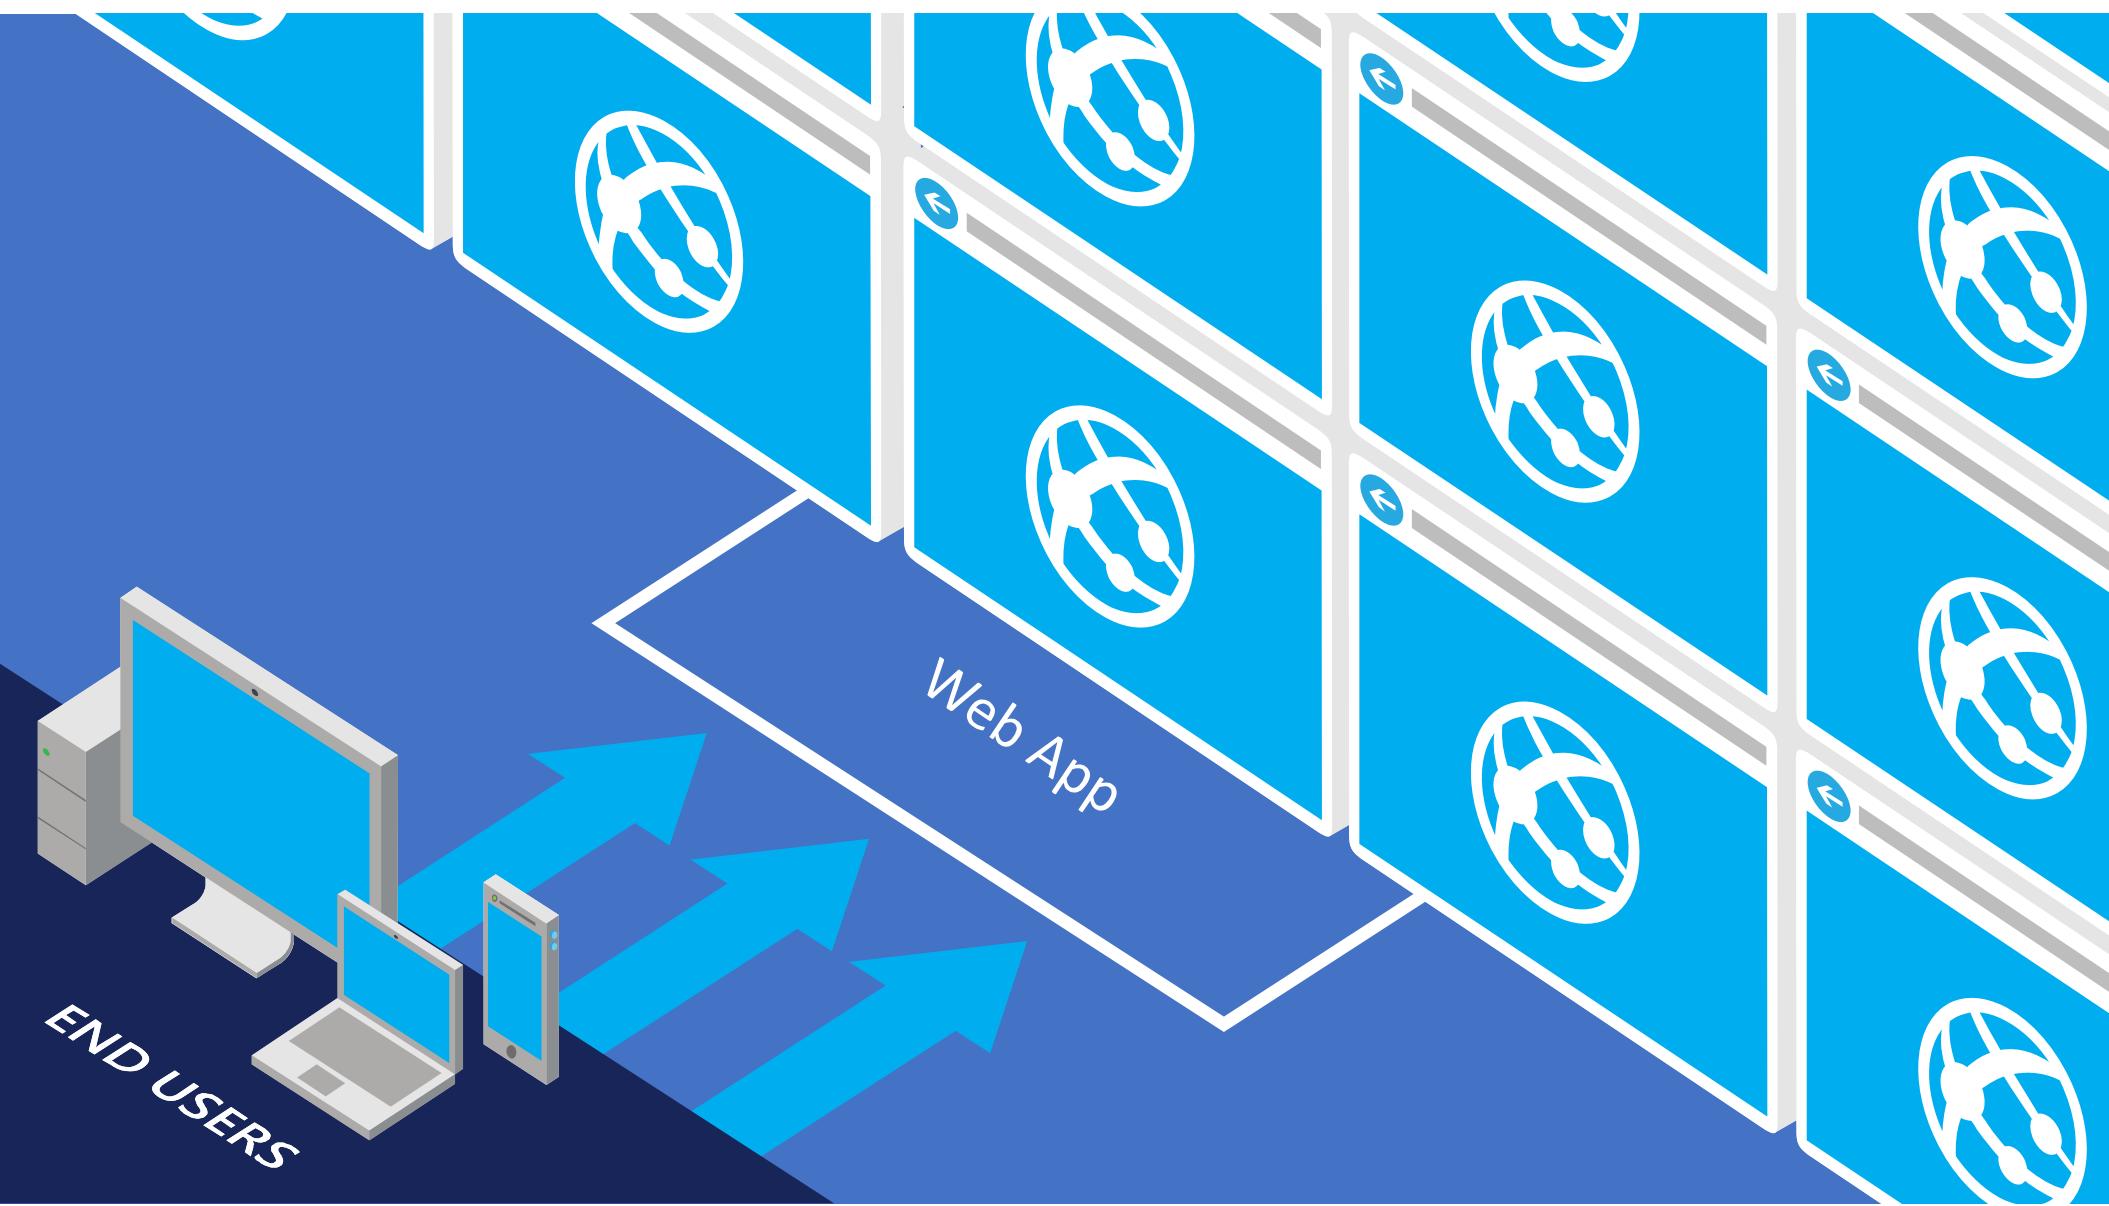

### Vary the count

- Max 3\* instances
- Max 10 instances
- Max 20/50\*\* instances

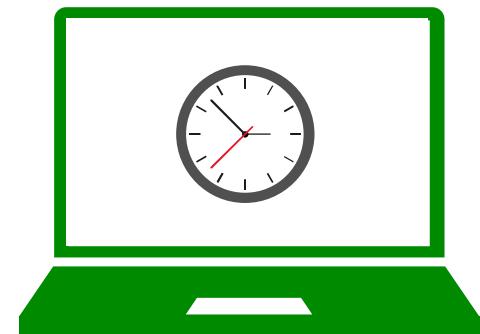

## Horizontal Scaling

# Demo: Scaling Web App

# Securing an App Service

- Authentication
  - Enable authentication – default anonymous
  - Log in with a third-party identity provider
- Security
  - Troubleshoot with Diagnostic Logs – failed requests, app logging
  - Add an SSL certificate – HTTPS
  - Define a priority ordered allow/deny list to control network access to the app
  - Store secrets in the Azure Key Vault

App Service Authentication

Off On

Action to take when request is not authenticated

Log in with Azure Active Directory

Allow Anonymous requests (no action)

Log in with Azure Active Directory

Log in with Microsoft Account

Log in with Facebook

Log in with Google

Log in with Twitter

Protocol Settings

Protocol settings are global and apply to all bindings defined by your app.

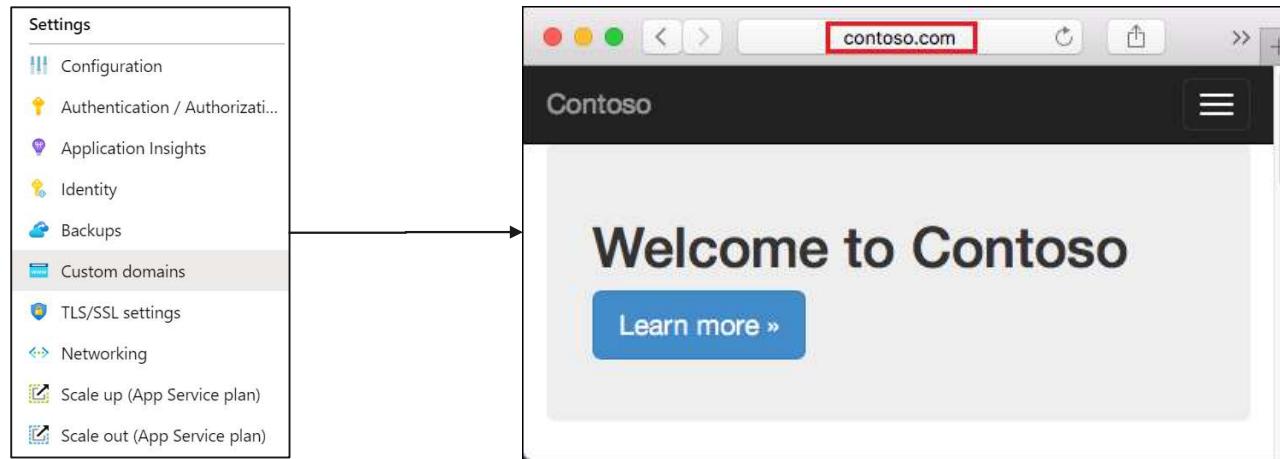

HTTPS Only: Off On

Minimum TLS Version: 1.0 1.1 1.2

TLS/SSL bindings

Host name	Private Certificate Thumbprint	TLS/SSL Type
No TLS/SSL bindings configured for the app.		

# Custom Domain Names

- Redirect the default web app URL
- Validate the custom domain in Azure
- Use the DNS registry for your domain provider – create a CNAME or A record with the mapping
- Ensure App Service plan supports custom domains

# Backup an App Service

- Create app backups manually or on a schedule
- Backup the configuration, file content, and database connected to the app
- Requires Standard or Premium plan
- Backups can be up to 10 GB of app and database content
- Configure partial backups and exclude items from the backup
- Restore your app on-demand to a previous state, or create a new app
